

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. BUREAU OF AGRICULTURAL STATISTICS, }  
St. PAUL, Sept. 1, 1896.

*To His Excellency, D. M. Clough, Governor of Minnesota:*

SIR: I have the honor herewith to submit the twenty-seventh annual report of the Commissioner of Statistics.

Respectfully,

J. J. LOMEN,  
*Commissioner of Statistics.*

## REMARKS.

---

The twenty-seventh annual report on agricultural statistics is as complete as its predecessors, and as complete as it has been possible to make it.

There seems to be a very decided aversion in a number of counties to the furnishing of correct and full statements to the township assessors. The belief, that the giving of correct statements of crops raised is playing into the hands of the elevator companies and the wheat gambler, is general. The local assessor is often to blame. He fails to gather the required statements, either because he honestly believes that correct and full statements of crops raised does work an injury to the producer, or he is indifferent whether the statements are made or not, because he is not paid extra for this work.

Through an error in the original law, the compensation allowed to each assessor for the taking of agricultural statements is only twenty cents for each town. The law was intended to read "ten cents a farm," but the word farm was made to read "form." Ten cents a farm would be a reasonable compensation, and I believe would insure full and correct statements in most cases. Even if the assessor failed to get the voluntary statement from the producer, he would, from his intimate knowledge of his neighbor's farm, be able to give a very reliable and valuable estimate, and would no doubt do so if he was paid a reasonable compensation for such work.

I respectfully submit to the coming legislature that it devise a remedy that will overcome the reluctance of the assessor to gather these data and that will hereafter insure more complete reports.

J. J. LOMEN,  
Commissioner of Statistics.

## ANNUAL WEATHER REVIEW FOR 1895.

U. S. Department of Agriculture,  
Weather Bureau Station,  
St. Paul, Minn., Jan. 1, 1896.

Latitude, 44° 58'. Longitude west from Washington, 16° 15'. Longitude west from Greenwich, 93° 3'.

The meteorological conditions during the year just ended were remarkable for the evenness of temperature, sunshine and rainfall during the spring and summer seasons, and the unprecedentedly warm spell in September, followed by an almost unprecedentedly dry spell in October, but fortunately these occurrences caused no loss aside from the inconvenience to human and perhaps animal life in general. As to vegetation, the favorable conditions mentioned at first, it is almost needless to add, were about perfect, and the phenomenal crop of the Northwest for 1895 will emphasize the statement. The condition of the Mississippi river is another noteworthy thing, reference to which will be made in another paragraph. The mean temperature of the year was 43.5°, or just average. In other words, it was no hotter nor colder than usual. The highest temperature was registered September 17th and the lowest February 1st, the registrations being 97° above and 26° below zero, respectively. The temperature went above 90° on fourteen days, seven of which were during the first twenty days of September, and that spell was not only the hottest of the year, but the hottest of any corresponding portion of September on record; the daily average temperature then was 10° above normal. Temperature went to 32° (freezing point) or below it at some time of the night or day on 154 days, and it remained at or below that point at all hours, both day and night, on eighty-nine days.

In regard to precipitation (rain and melted snow), the total for the year was 24.26 inches; that is deficient as compared to the average by 3.52 inches. There were 106 days with .01 inch or more precipitation, on thirty-three of which snow fell. Total snow fall (if melted) 23.4 inches. Days clear, 128; fair, 129; cloudy, 108—on a scale of 0 to 10, 0 standing for a cloudless sky and 10 an entirely cloudy one; 0 to 3 is classed as clear, 4 to 7, inclusive, fair, and 7 to 10 cloudy. Average cloudiness for the year, 5.1. Total wind movement in miles, 69,145; prevailing direction, southeast; highest velocity, southeast, fifty-five miles for five minutes on September 6th. There were 38 thunder storms, of which March had 1, April 4, May 8, June 11, July 3, August 9, and September 2. Only five displays of the aurora borealis were observed—two in September and three in October.

Referring to the Mississippi river. On the date of its opening, or when the ice went out,—March 22d,—the reading of the gauge was only 0.2 of a foot; the maximum or highest reading of the year was 4.6 feet, June 16th and 17th. The startlingly insignificant amount of water in the river during the early season as compared with former years calls for more than a mere note, and especially since during April and May, or the season for highest water and floods, the gauge readings ranged from a minimum of 0.3 to a maximum of 2.5, while during July and August, or when the river is usually lowest, they ranged from 0.8 of a foot to 3.7 feet. As to these details, elaboration may be out of place, but the protracted and intense drouth and heat of the summer and early fall of 1894 and the consequent complete drying up of most of the marshes and other water receptacles and small lakes, and marked decrease of larger ones, and also the artificial ones, or reservoirs constructed by the government for the storage of surplus water in spring to be liberated in summer or when most needed, must partly account for the remarkable stages of water given above. The snowfall last winter was but little less than average, but when it melted in the spring about all the resulting water was greedily absorbed by the dried marshes, etc., and what surplus there might be was stored as stated, and liberated in summer.

The accompanying tables contain details and all that is of additional importance.

STATE OF MINNESOTA, DEPARTMENT OF STATE, }  
BUREAU OF AGRICULTURAL STATISTICS. }

*To His Excellency, John Lind, Governor of Minnesota:*

Sir: I have the honor herewith to submit the report of the Commissioner of Statistics for the years 1895 and 1896.

Respectfully,

J. J. LOMEN,  
*Commissioner of Statistics.*

## REMARKS.

---

The twenty-eighth and twenty-ninth annual reports are published at the same time, and under one cover. Owing to lack of funds the twenty-eighth report was not published in 1897, and for the same lack of funds in 1898 the publication of the two reports (twenty-eighth and twenty-ninth) have been delayed until this time. It is to be hoped that the present legislature will appropriate sufficient moneys for this and other reports for the coming biennial period, and also enact laws that will ensure better and more complete returns of the agricultural products of this state.

J. J. LOMEN,  
Commissioner of Statistics.

## THE WEATHER OF THE YEAR 1898.

---

UNITED STATES DEPARTMENT OF AGRICULTURE.

Weather Bureau, St. Paul, Minn. }

Latitude  $44^{\circ} 58'$ , Longitude  $93^{\circ} 03' W.$  from Greenwich. }

During the year 1898, the weather, according to the records of this office, was about 2 degrees warmer than average, and somewhat dryer than usual, but in other respects the conditions were about normal.

The average annual temperature for St. Paul and vicinity, determined from the last twenty-eight years' record, is  $43.5$  degrees; the average for the year in question is  $44.4$  degrees, giving an excess of nearly 2 degrees. The highest temperature was  $95$  degrees, registered August 22d, and the lowest,  $19$  degrees below zero, was registered December 31st. There were 149 days that the temperature went to or below ( $32^{\circ}$ ) freezing point, and 73 days on which it remained at or below that point at all times both day and night.

The average precipitation, deduced from the last twenty-eight years' record, is  $27.47$  inches, the total fall for the year 1898 is  $25.34$  inches, hence a deficiency of  $2.13$  inches; there were 119 clear, 145 fair and 101 cloudy days, and 99 days on which .01 of an inch or more of rain or melted snow fell; there were 36 days on which snow unmelted fell to a depth of 0.1 of an inch or more; the total depth, if unmelted, would make  $45.8$  inches.

The average cloudiness, on a scale of 0 to 10, "0" representing a cloudless sky and "10" an entirely cloudy one, was 5.2.

The data, "hours of sunshine," is published in tabulated form for the first time, and gives the possible number of hours of sunshine for each month, and the total, as well as the percentages. The total sunshine is determined from the photographic sunshine recorder, an instrument that absolutely records the time hours, and fractions of hours during which there is sunshine; the possible hours of sunshine, annually for St. Paul, is 4,466 hours 18 minutes;

the actual record for 1898 is 2,454 hours 12 minutes, percentage 55. For further details see table.

The mean height of the barometer, corrected to sea level, was 30.00 inches; the wind blew oftener from northwest than from any other point; total movement, all directions considered, was 66,475 miles; it did not attain a dangerous velocity at any time; the highest registered was NW. 36 miles an hour, determined from 5 minutes' record, June 25th, and November 22d.

#### MISCELLANEOUS NOTES.

The last killing frost of spring was noted April 19th, and the first killing frost in autumn did not occur until October 6th. There were light frosts between these dates, but there was an interval of about five and a half months that the temperature was not adverse to vegetation. All products of the field and garden had matured long before the first killing frost of autumn.

There were 25 thunder storms and 3 auroral displays during the year, and 11 days with dense fog, lasting from 1 to 4 hours each day; hail of a very light kind fell on but 1 day.

The stage of water in the Mississippi river, as indicated by the gauge at St. Paul, was very moderate, although there was a sufficiency for "boating" throughout the season. The maximum and minimum gauge readings ranged from 10.7 to 2.7 feet. All that may be of further importance is given in tabulated form herewith.

*To His Excellency, S. R. Van Sant, Governor of Minnesota:*

Sir: I have the honor herewith to submit the report of the  
Commissioner of Statistics for the years 1897 and 1898.

Respectfully,

J. J. LOMEN,  
*Commissioner of Statistics.*

## REMARKS.

---

The thirtieth report is a biennial report, comprising the crop years 1897 and 1898. The tables contained in Chapter I are partially as returned by Assessors to County Auditors. Where returns were incomplete, or no returns made for a county, I have made what I considered a fair and reasonable estimate, based on such data as I had from former reports, as to yield of such county, and such information as I could gather, thereby making the total for the state, at least make a reasonable showing of its principal cereals. The tables in Chapter II are as returned by County Auditors for their respective counties. Counties making no returns are therefore not contained in Chapter II.

J. J. LOMEN,  
*Commissioner of Statistics.*
